Define Problem Statements

AI/ML and Generative AI Track • Project Documentation

Project	Trip Genius AI (VoyagePlan Travel Planner)	**Date**	26 October 2026
Submitted by	Kumkum Thakur (individual project)	**Hall Ticket No.**	0157CS241131
College	LNCTS	**University**	RGPV

Customer problem statements

ID	Customer	Trying to	But	Because	Impact / feeling
PS-1	A traveller planning a short holiday	Create a practical itinerary matched to interests, dates, budget and pace	Generic online lists need manual comparison and arrangement	Information is spread across blogs, maps and travel sites	Overwhelmed and unsure how to organise each day
PS-2	A traveller revising an existing plan	Change preferences and keep the trip saved	Rebuilding a plan from scratch is repetitive	Preferences and trip details are lost across sessions	Frustrated by repeated work
PS-3	A returning user	Find and continue a previous trip	Notes and screenshots are scattered	No single account-based place stores trips	Anxious about losing details

Problem statement

Build a web application that accepts a traveller's destination and preferences (dates or duration, interests, budget and pace), generates a structured day-wise itinerary using an AI service, and allows an authenticated user to save, revisit and edit trip plans through a persistent account-based experience.

Scope boundaries

Trip Genius AI helps create and manage itinerary plans. It is not a booking engine, payment processor, live availability service or real-time pricing system. Generated suggestions are a draft that the traveller should verify before travelling.
