Problem–Solution Fit Canvas

AI/ML and Generative AI Track • Project Documentation

Project	Trip Genius AI (VoyagePlan Travel Planner)	**Date**	26 October 2026
Submitted by	Kumkum Thakur (individual project)	**Hall Ticket No.**	0157CS241131
College	LNCTS	**University**	RGPV

Canvas area	Trip Genius AI findings
1. Customer segments	Students, solo travellers, couples, families and trip organisers who want help structuring a trip.
2. Problems / pains	Research is fragmented; arranging activities day-by-day takes time; plans are difficult to keep updated.
3. Triggers to act	Upcoming holiday, fixed travel dates, budget constraints or the need to coordinate interests.
4. Emotions before / after	Before: overwhelmed or uncertain. After: organised and confident, while understanding that suggestions need verification.
5. Available solutions	Search engines, blogs, maps and spreadsheets give broad choice but need manual synthesis; booking apps focus on transactions rather than personalised planning.
6. Customer limitations	Limited time, varying budgets, incomplete destination knowledge, device / connectivity constraints and changing plans.
7. Behaviour / intensity	Users compare destinations and activities repeatedly and revisit plans as dates approach.
8. Channels	Online: website, search and social sharing. Offline: word of mouth and college project demonstrations.
9. Root causes	Travel information is spread across sources; users must convert lists into a coherent schedule themselves.
10. Proposed solution	A web application that accepts trip preferences, requests an AI-generated itinerary, and supports sign-in, saving and editing trips.

Fit hypothesis: *a structured, editable, saved itinerary reduces planning effort. This canvas is a product hypothesis; validating it would require feedback from real users.*
